Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                           Q
                                                                                                                                                   The present sequence encodes a cyclohexadepsipeptide synthetase polypeptide. The specification describes a method for producing heterologous polypeptide. The method comprises cultivating a mutant of a parent filamentous fungal cell, which produces less cyclohexadepsipeptide than the parent filamentous fungal cell which produces less cyclohexadepsipeptide than the parent filamentous fungal cell wh production of biologically active compounds e.g. antibiotics.
                                                                                                                                                                                                                                                                                                                             100.0%; Score 1001; DB 21; Length 11212; 100.0%; Pred.                                                             like activity. This sequence was isolated from Tolypocladium niveum (formerly known as T. inflatum GAMS). The enzyme encoded by this sequence catalyses the peptide biosynthesis of cyclosporins and structurally related molecules. This sequence may be used for the production of cyclosporin by transforming a vector containing this sequence in to a recombinant host. This allows effective production
                                           sequence encodes an enzyme which has cyclosporin synthetase
                                                                                                                                                                                                                                                                                          Length 46899;

Lambda clone RAC4 contained a 1.1 kb PstI fragment, a 1.9 kb ExoRT-Sall fragment and a 650 HindIII-PstI fragment, which were subcloned in plasmid vectors and combined to give the sequence of the AR DNA (see also AAQ78281).

Lambda clone RAC4 contained a 1.1 kb PstI fragment, a 1.9 kb ExoRi-rsall fragment and a 650 HindIII-PstI fragment, which were subcloned in plasmid vectors and combined to give the sequence of the AR DNA (see also AAQ78276).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          480
                                                                                                                                    programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CAGGTTGCGTACATGTTACCATCGACGGCGAGCTCTACCAGTCCCTTCGAGCCTTCTGCA 300
              Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella phoemoniae, Pseudomonas aeruginosa and Enterococcus facealis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GGCTGGAGGGGGGGGGCGCAGCCCAGCTACTAGGAAGGCCCAGCTGGGAACG

in a cell density dependent fashion. This "bacterial signalling" is called "quorum sensing and response". Quorum sensing allows a bacterial species to sense its own number and requiste gene expression according to population density. The present sequence is an open reading frame (OFF) of a Pseudomonas aeruginosa quorum sensing controlled gene. Inhibitors of quorum sensing signalling renders a bacterial population more susceptible to treatment. The present invention relates to a method for identifying modulators of quorum sensing signalling in Pseudomonas aeruginosa bacteria. Modulators of quorum signalling may be used to treat P.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       containing open reading frames (ORRS) 31.40. The proteins encoded by the gene cluster are useful for producing peptides and/or polyketide metabolites, especially bleomycin or bleomycin analogues. They are also useful for chemically modifying biological molecules to produce branched methyl groups, and for coupling amino acids and fatty acids. They may be reacted with an apo-carrier protein and coenzyme A to produce a holo-carrier protein. The BLM gene cluster or catalytic domains can be used individually or collectively to produce thiazoline, bithiazoline and bithiazoline-containing microbial metabolites. The BLM gene cluster may also be used to produce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAB07583, AAB07584, AAB07585,

genomic sequenced tags (GST), examining the array, and determining relative gene expression by an observed hybridisation reporter signal of a spot in the array. The method is useful for measuring the expression of genes in a first Bacillus cell relative to expression of the same genes in one or more second Bacillus cells. The method is useful for monitoring genes in one or more second Bacillus cells. The method is useful for monitoring genes, identifying possible functions of unknown open reading frames and monitoring gene copy number variation and stability. Monitoring changes in expression of genes may be used to provide a representation of the way in which Bacillus cells adapt to changes in culture conditions, environmental stress or other physiological provocation. Extensive follow-up characterisation is unnecessary, when one spot on an array available. This sequence represents a genomic sequence information is the method of the invention.
                                                                                                                                                                                                              Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    BP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (TIGR-) TIGR INST GENOMIC RES.                                                                                                        ò
                                                                                                                                                                                                                                                                                                                                        having the biological function of Theopeptide Synthase. The invention also describes (1) recombinant expression vectors containing (1): (2) prokaryotic and eukaryotic cells transformed our transfected with (1) or the vector of (2): (3) production of lipopeptide synthases by culturing cells of (2): (4) expression products (II) of (I), and synthetic proteins or peptides with the same sequences; (5) mono- or poly-clonal antibodies (Ab) specific for (II): (6) hybridoma cells that produce monoclonal Ab; cragments, are useful for expression of recombinant lipopeptide synthases, and as probes and primers for detection, isolation and synthases, and as probes and primers for detection, isolation and complification of full-length cDNA sequences. (I) are used to produce transgenic plants. Lipopeptide synthases are useful for production of antiviral, antibacterial or antifugal lipopeptides, particularly useful for treatment of plants, and for production of lipopeptide surfactants used for increasing bloavallability in microbilal depolution processes (acting as menisifiers) and in tertiary crude oil recovery. Individual subunits from different lipopeptide synthases may be combined to allow subunits from different lipopeptide synthases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1174 TCGTTCGGCCTGCTGGCGCCGCTACAGCGGCAACGAGAAGATCAACATCGGCGTGCCC 1233

```
bloomgineering of antibloids structures. An isolated polypeptide or its encoding nucleic acid sequence is useful for generating derivatives of ramoplanin, for improving production or for producing variants of other antibiotics of the peptide class. The isolated polypeptides are useful for synthesis of ramoplanin in vivo or in vitro, as an adenylation domain in conjunction with other peptide synthetase modules and allowing the incorporation of Thr into a peptide antibiotic precursor, for modifying fatty acid structure and/or enhancing fatty acid incorporation into the peptide antibiotic structure, for production of an hydroxyphenylglycine (HPG)-containing peptide antibiotic, for enhancing secretion of ramoplanin or its variants and derivatives, for enhancing uptake of precursors for ramoplanin blosynthesis, for enhancing production of ramoplanin products or its variants or derivatives, to chlorinate HPG of a peptide antibiotic precursor, and for designing specific nucleotide probase and primers for identifying and isolating putative lipdepsipeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             polypeptide selected from a polypeptide of open reading frames (ORF)
1-32. The isolated polypeptides are useful for chemically modifying a
blological molecule that is a substrate for a polypeptide encoded by
ramoplanin blosynthesis gene cluster, by contacting the blological
molecule with the isolated polypeptide, where the polypeptide chemically
modifies the blological molecule. The method comprises contacting the
blological molecule with at least two different polypeptides encoded by
amoplanin ORFs 1-31. The polypeptides are useful for directing the
blosynthesis of the antibiotic ramoplanin in microorganisms. An isolated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          -producing microorganisms. This polynucleotide sequence represents the 88421nt genomic DNA of a ramoplanin producing Actinoplanes sp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel isolated ramoplanin biosynthetic pathway polypeptide useful for chemically modifying biological molecule that is a substrate for a polypeptide encoded by a ramoplanin biosynthesis gene cluster -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAO22152, AAO22153, AAO22154, AAO22155, AAO22156, AAO22157, AAO22159, AAO22159, AAO22161, AAO22161, AAO22161, AAO22161, AAO22161, AAO22161, AAO22161, AAO22161, AAO22171, AAO22171, AAO22173, AAO22173, AAO22171, AAO22172, AAO22173, AAO22173, AAO22173, AAO22173, AAO22173, AAO22173, AAO22173, AAO22178, AAO22177, AAO22178, AAO22177, AAO22178, AAO22177, AAO22178, AAO22178, AAO22177, AAO22178, AAO221778, AAO22178, AAO22188, AAO28188, AAO28188, AAO28188, AAO28188, AAO28

This fragment was isolated using primers derived from the Tolypocladium niveum (formerly known as T. inflatum GAMS) cyclosporin synthetase gene, corresponding to bases 35073-35092 and 37848-37829. The T. niveum gene encodes an enzyme which catalyses the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          37848-37829. The T. niveum gene encodes an enzyme which catalyses the peptide biosynthesis of cyclosporins and structurally related molecules. The T. niveum sequence may be used for the production of cyclosporin by transforming a vector containing the gene sequence in
